Convenient Care Clinics: Reducing Costs For Consumers and Third-Party Payers

QUESTION: Are convenient care clinics (CCCs) more affordable than other health care delivery outlets?

ANSWER:

CCCs are more cost-effective for basic healthcare needs than physicians' offices, urgent care clinics and emergency rooms.¹ This is possible because CCCs provide high-quality care by certified nurse practitioners or physician assistants. CCCs are affordable to the insured, underinsured and uninsured alike.

CCCs accept most insurance co-payments, and patients without insurance typically pay \$40 to \$75 for a clinic visit, which is far less than they would be billed for emergency room care.

THE FACTS:

Average costs for treatment²:

Convenient Care Clinic - \$60

Emergency department - \$356.00

Urgent Care - \$124.00

Physician Office - \$127.00

Care provided at retail clinics costs 30% to 40% less than similar care at physician offices and approximately 80% less than similar care at emergency departments.¹

Lower CCC costs also take the pressure off of overburdened emergency rooms by offering significantly less expensive treatment for basic medical needs.

- 12 to 14% of all ED visits can be seen at convenient care clinics.³

Convenient Care Clinics offer a quick, affordable alternative for patients with pressing, non-emergency medical needs.

- CCCs prominently display their healthcare services and pricing, so patients know costs upfront.
- CCCs may reduce health care costs by providing preventive care (e.g., flu shots) and facilitating earlier access to care.
- CCCs demonstrate significant cost savings for both consumers and third-party payers.

Total treatment costs for a CCC operator were found to be approximately \$300 less than emergency departments.²

- Blue Cross and Blue Shield of Minnesota eliminated co-pays for enrollees who used a clinic, citing \$1.2 million in cost savings.⁴
